

Rose Skin Care Products Protocol

Glycolic 30% pH 3.0

In-office peel treatments to even skin tone and discoloration and to jump start a complete skin rejuvenation process. Glycolic peel can be performed in combination with a mild facial treatment for a full service procedure. This peel has buffered Glycolic Acid, otherwise known as Alpha-Hydroxy Acid or Fruit Acid. It is naturally found in grapes, apples and sugar cane. Glycolic Acid is one of the most effective exfoliation agents known.

Glycolic acid indications:

- Improves dry skin
- Sun and environmentally damaged skin
- Diminishes age spots
- Reduces oil and acne
- Decreases fine lines and wrinkles

1. Review with patient their skin type, age, previous product usage and if necessary consider performing a patch test to skin for sensitivity.

2. Gently wash face with Green Tea Cleanser, rinse with water and pat dry.

3. Use the pre-peel on gauze to wipe the skin. Dry thoroughly.

4. Apply 1-2 ml 30% peel to a gauze pad or use a Q-tip and apply to the face using a mild rubbing action.

Avoid eye areas, lips, and insides of nostrils.

5. Leave on initially for 3-4 minutes, building up to 7-10 minutes or more as patient tolerance increases.

6. After reaching the desired time wash off with cold water. If needed, you can use the Green tea neutralizer over the skin. Wash the neutralizer off. NOTE: Should redness or excessive stinging occur, wash off immediately. Pat the skin dry with a clean cotton or tissue. Do not rub the skin with the tissue.

7. Use Complexion Protection SPF35 for anti-aging and UVA & UVB protection as skin is more sensitive to sunlight after performing peel and exfoliation treatments.
